ABSTRACT

Initiation of insulin therapy is challenging in the primary care setting without nursing support. Doctors have to prepare their practices to deal with these challenges in order not to delay insulin therapy when needed.

Keywords: Insulin therapy, challenges, strategies

INSULIN THERAPY IN TYPE 2 DIABETES MELLITUS

Insulin therapy is initiated for patients early in their course of diabetes to relieve symptoms of severe hyperglycaemia or in the hope of achieving remission and during the course of diabetes to attain optimal control. In the specialist outpatient setting, successful initiation of insulin therapy is very much dependent on having dedicated diabetes nurse educators (DNE) who would ensure the smooth transition of the therapy for the patient and the doctor. With the increasing prevalence of diabetes in Singapore, most patients with Type 2 Diabetes Mellitus (T2D) are now receiving their care in the community. The initiation of insulin in the polyclinics is facilitated by nurses trained in diabetes management who can assist with the initiation, optimisation and intensification of the therapy. For family practices that are not often supported by DNE, initiation of insulin therapy may be challenging. This article hopes to share some clinical pointers to help these doctors prepare their practices for their patients who require insulin therapy.

Empowering Patients During Insulin Initiation

A useful resource that can be obtained easily online is the Royal College of Nursing booklet on “Starting injectable treatment in adults with Type 2 diabetes”. The chapter on a step-by-step guide to insulin therapy includes details on first appointment/first injection, choosing a delivery device, teaching injection technique, choosing injection site, rotating injection sites, the timing of injection, insulin dosage, storage, and checklist. The following chapter on essential education elaborates on the subjects to be covered at three stages of insulin therapy: immediately upon starting the therapy; within the first few weeks of starting therapy and once the patient is feeling more confident with the therapy. This is a very easy book to read and provides a simple, comprehensive and practical overview for the initiation of insulin therapy.

In preparation for the conversation on insulin therapy with the patient, it is recommended that the practice gathers together the armamentarium or tool kit required for the education and support of insulin therapy. This could include:

1. Blood glucose monitoring (BGM) gadgets – glucometer, strips, lancets (include safety lancets that do not require a separate lancing device), lancing device, record book, swabs, and sharps disposal. If available, Flash (intermittent) continuous glucose monitoring demonstration kit or online video.

2. Insulin therapy gadgets: vial, disposable prefilled pens, self-fill pens, syringes (30, 50, 100cc; 6 and 8mm), pen needles (gauge 31-33, length 4, 5 and 6mm), insulin wallets, sharps disposal, and swabs.

3. Written information on instructions for insulin dose and time, delivery device, rotating sites, hypoglycaemia management and sick day management.

4. Travel advice and letter for airport securities.

The doctor should be prepared to spend time to proactively engage and work with the patient to deal with the challenges faced with insulin therapy. These anticipated barriers and challenges could be explored with the patient early on and during the course of diabetes to ensure timely initiation of insulin therapy when required. The doctor should be careful not to use insulin therapy as a threat for poor control but rather as an effective therapeutic option. The mnemonic PICK DMP is a useful reminder of the common barriers and challenges encountered. The table below elaborates on the use of this mnemonic.
### Table 1: Common barriers in insulin initiation and proposed strategies

<table>
<thead>
<tr>
<th>Challenges/Barriers</th>
<th>Assess</th>
<th>Strategies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pain</td>
<td>It is going to be painful.</td>
<td>Demonstrate how insulin is administered. Share experiences of others/self. Offer trial injection. Offer insulin port or pump for those on multiple dose injections.</td>
</tr>
<tr>
<td>Inconvenience</td>
<td>It will disrupt my lifestyle.</td>
<td>Demonstrate the convenience of insulin pens. Offer to initiate regimen that will lead to least disruption.</td>
</tr>
<tr>
<td>Cost</td>
<td>It is going to be expensive.</td>
<td>Offer cost saving measures or funding application.</td>
</tr>
</tbody>
</table>

### CHRONIC DISEASE MANAGEMENT

<table>
<thead>
<tr>
<th>Challenges/Barriers</th>
<th>Assess</th>
<th>Strategies</th>
</tr>
</thead>
<tbody>
<tr>
<td>K(C)ompetence</td>
<td>I’m not sure I can handle so much.</td>
<td>Offer support for first jab and ongoing support until confident. Offer support from diabetes centre/specialist clinic if more assistance/training required. Goal setting to be decided with patient using SMART (specific, measurable, achievable, relevant/realistic and time-based) and review and adjusted accordingly.</td>
</tr>
<tr>
<td>Denial</td>
<td>I’ll try harder; I don’t need this yet.</td>
<td>Understanding of diabetes as a “silent killer”, concept of complication, progression of diabetes and failure of oral agents (not patient’s failure). Offer individual or group education, peer support. Stage approach to initiation of insulin – raise awareness and understanding of glycaemic levels and desired targets through SMBG training and interpretation. Offer trial of insulin with review date.</td>
</tr>
<tr>
<td>Myth</td>
<td>If I go on insulin, I’ll lose a foot, my kidney or end up dying.</td>
<td>Source of information: level of fears and misunderstanding. Understanding of hyperglycaemia as cause of complications and need to achieve glycaemic targets. Offer evidence from trials with regards to safety and efficacy of insulin therapy; other patient’s testimonies; peer support group. Reinforce sick day management and hypoglycaemia management.</td>
</tr>
<tr>
<td>Phobia</td>
<td>I can’t possibly give myself an injection.</td>
<td>If there’s needle phobia. Understanding of action of insulin, why hypoglycaemia happens, how to avoid and manage if it happens. Ability to manage hypoglycaemia. Indication for insulin, fear of weight gain and understanding of reason for weight gain and measures to avoid excessive weight gain. Offer to refer to a psychologist. Caregiver to perform jabs. Offer auto-injector, insulin port. Offer measures to reduce risk of hypoglycaemia – start with low dose and close monitoring of response and review during optimisation of therapy. Offer measures to reduce weight gain – lifestyle advice, concomitant use with SGLT-2 inhibitors, GLP-RA and metformin.</td>
</tr>
</tbody>
</table>
Steps to Insulin Initiation and Intensification of Therapy

The doctor should consider initiating insulin therapy when:

1. Glycaemic targets are not met on optimal treatment with oral glucose-lowering agents.
2. Patient has symptomatic hyperglycaemia.

There are various formulations of insulins that the doctor may choose. The Appropriate Care Guide (ACE) on Initiating Basal Insulin in Type 2 Diabetes Mellitus is a useful resource to guide doctors in their choice of basal insulin and steps in titration. Basal insulin can be started at a dose of 0.1 – 0.2 units/kg/day depending on the patient's age, comorbidities and blood glucose profile. The dose can be titrated by 2-4 units once or twice a week until the target fasting blood glucose is achieved. Should the patient's HbA1c remain poorly controlled, and the patient has postprandial hyperglycaemia or a basal insulin dose that exceeds 0.5 units/kg/day, the doctor should consider adding on prandial insulin. This can be done in form of basal-plus, basal-bolus or premixed (biphasic) insulin, depending on the patient profile. Injectable GLP-1 receptor agonists may also be considered.

Diagram 1: Algorithm for insulin therapy

Insulin prescription is made easier if the doctor can figure out the glycaemic profile of the patient. A prescription of BGM to be performed by the doctor, patient or caregiver should first be given to evaluate the glycaemic profile of the patient. It can be done using the FITT model as illustrated below:

Table 2: FITT model for BGM

<thead>
<tr>
<th>Frequency</th>
<th>Intensity</th>
<th>Time</th>
<th>Targets – to be individualised</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily for three days</td>
<td>2 points</td>
<td>BT &amp; FBG</td>
<td>FBG: 4 – 7 mmol/L; BT 7 – 10 mmol/L</td>
</tr>
<tr>
<td>Once a week</td>
<td>2 points</td>
<td>FBG &amp; PD</td>
<td>FBG: 5 – 8 mmol/L; PD: 5 – 8 mmol/L</td>
</tr>
<tr>
<td>On off days or weekend</td>
<td>2 up to 7</td>
<td>Before and 2 hours after meals &amp; BT</td>
<td>Pre-meal BG &lt; 7 mmol/L; post-meal BG &lt; 10 mmol/L</td>
</tr>
</tbody>
</table>

Legend: FBG: fasting blood glucose; PD: pre-dinner; BT: bedtime

Figure 1: Examples of glycaemic profiles and proposed clinical management

All day hyperglycaemia
BGM: BT & FBG
Insulin: Basal insulin – once a day either morning or bedtime

Daytime hyperglycaemia
BGM: FBG, Pre-lunch and Pre-dinner
Insulin: Premixed (30/70) at breakfast

Predominant postprandial hyperglycaemia.
BGM: Pre-meal & mid-day
Insulin: Premixed (50/50) at culprit meal
INSULIN THERAPY IN TYPE 2 DIABETES MELLITUS

Predominant postprandial hyperglycaemia.
BGM: Pre and post-meal
Insulin: Prandial insulin

Desired blood glucose levels after initiation of insulin therapy:

Normoglycaemia.
BGM: FBG; when hungry
No evidence of hypoglycaemia.

Legend: FBG: fasting blood glucose; BT: bedtime

BEWARE OF HYPOGLYCAEMIC UNAWARENESS

Hypoglycaemic unawareness occurs when the patient does not develop the early warning symptoms of hypoglycaemia when their blood glucose levels are low. These symptoms include tremors, palpitations and diaphoresis. This may occur when the patients have repeated episodes of hypoglycaemia or concomitant autonomic neuropathy, and this results in a significant increase risk of developing severe hypoglycaemia. Patients with hypoglycaemic unawareness should be advised to increase their glycaemic targets for a few weeks to avoid hypoglycaemia.

CONCLUSION

In summary, insulin therapy is an important and effective therapeutic option in the management of Type 2 diabetes. Initiation, optimisation and intensified will be challenging if doctors are not prepared to deal with the challenges. With careful preparation as proposed above, insulin therapy can be initiated safely and effectively even in primary care setting.

LEARNING POINTS

• Insulin therapy should be introduced as an effective therapeutic option and not used as a threat for poor control.
• Challenges faced with insulin therapy should be managed with patients early in their course of diabetes.
• Clinicians have to be prepared to deal with the challenges faced with insulin therapy.
